

ABSTRACT

A striplike body of vegetation which is used to cover roofs with thin layers of vegetation. The inventive body of vegetation is comprised of structural matting arranged on at least one base. The structural matting can be filled with a substrate and germinative plant material, especially seeds, shoots, spores or parts of shoots. The base consists of a feltlike nonwoven material which is only slightly permeable with respect to wind but which has a substantial water storage capacity. According to the invention, the striplike body of vegetation is characterised in that at least the base is permeable with respect to wind as a result of the introduction of holes.
